

ThinkTac Technical Assessment – Part 4: Reflection

Candidate: Aashritha M B

Project: SlotWise (Self-Reflection)

The part of the assignment that took longer than I expected was integrating Firebase Authentication and Firestore while ensuring that route guards, real-time updates, and security rules all worked together correctly. Small configuration issues and permission errors required careful debugging before the application behaved as expected.

If I were starting again, I would spend more time planning the data model and application structure before writing code, which would make later features easier to implement. The area where I felt least confident was Firestore data modelling and designing efficient database interactions, particularly when handling relationships between slots and bookings. I would like to develop a deeper understanding of scalable Firestore design, security rules, and performance optimization so I can build applications that are easier to maintain and perform well as they grow.
