

ThinkTac Technical Assessment – Part 3: Site Critique

Candidate: Aashritha M B

Project: SlotWise (Website Evaluation)

I reviewed the ThinkTac homepage and found the overall design to be clean, modern, and visually appealing. The page clearly communicates the company's focus on AI-powered solutions, and the use of consistent branding helps create a professional first impression. Navigation is straightforward, with the main sections easily accessible from the top menu.

From a performance perspective, the homepage contains several large images, animations, and visual effects. While these elements improve the overall appearance, they can increase the amount of data that needs to be loaded, especially on slower internet connections or mobile devices. Some sections also rely heavily on JavaScript-driven scroll animations, which can create minor layout lag and delay how quickly users can interact with the page. Optimizing image sizes, lazy-loading non-critical assets only when they enter the viewport, and reducing animation weights on initial page load would significantly improve the page's Core Web Vitals (like Largest Contentful Paint) without changing the overall design.

From a user experience standpoint, the homepage presents a significant amount of information in a single scrolling page. Although the content is informative, first-time visitors may find it difficult to quickly identify the company's primary services or determine the next action to take. Some sections are visually similar, making it harder to distinguish between key product value propositions and secondary supporting content.

One specific improvement would be to introduce a prominent "Get Started" or "Book a Demo" Call-to-Action (CTA) that remains visible as users navigate the page. An engineer could implement this by modifying the existing navigation bar CSS with `position: sticky; top: 0; z-index: 1000;` and inserting an accent-colored button linked directly to the contact form. By making this primary action consistently accessible during scroll, interested users will not need to hunt for an acquisition point, creating a smoother user journey and improving conversion rates.
